

## COMPUTER METHODS

Course code: **11.9-WILŚ- BUD- MKOM- TB02**

Type of course: compulsory

Entry requirements: knowledge of computational methods,  
strength of materials and structural  
mechanics, computer system and  
programming language

Language of instruction: Polish

Director of studies: dr hab. inż. Mieczysław Kuczma prof. UZ  
Department of Structural Mechanics

Name of lecturer: dr hab. inż. Mieczysław Kuczma prof. UZ,  
dr inż. Krzysztof Kula, dr inż. Waldemar  
Szajna, mgr inż. Arkadiusz Denisiewicz

| Form of instruction      | Number of teaching hours per semester | Number of teaching hours per week | Semester | Form of receiving a credit for a course | Number of ECTS credits allocated |  |
|--------------------------|---------------------------------------|-----------------------------------|----------|---|----------------------------------|--|
| <b>Full-time studies</b> |                                       |                                   |          |   |                                  |  |
| Lecture                  | 15                                    | 1                                 | IV       | Grade                                   | 4                                |  |
| Class                    |                                       |                                   |          |   |                                  |  |
| Laboratory               | 30                                    | 2                                 |          | Grade                                   |                                  |  |
| Seminar                  |                                       |                                   |          |   |                                  |  |
| Workshop                 |                                       |                                   |          |   |                                  |  |
| Project                  |                                       |                                   |          |   |                                  |  |
| <b>Part-time studies</b> |                                       |                                   |          |   |                                  |  |
| Lecture                  | 10                                    | 1                                 | IV       | Grade                                   |                                  |  |
| Class                    |                                       |                                   |          |   |                                  |  |
| Laboratory               | 20                                    | 2                                 |          | Grade                                   |                                  |  |
| Seminar                  |                                       |                                   |          |   |                                  |  |
| Workshop                 |                                       |                                   |          |   |                                  |  |
| Project                  |                                       |                                   |          |   |                                  |  |

### COURSE CONTENTS:

Lecture

*Minimization of the functional of total potential energy and the equation of virtual work for problems in mechanics. Approximation properties of the finite element method (FEM) for weak formulations of boundary value problems in structural mechanics – approximation error, convergence rate and adaptive FEM. Numerical analysis of plates and shells by the finite element method – conforming and non-conforming finite elements. Numerical direct*

*and iteration methods for eigenvalue problems of structural stability and dynamics. Geometrically and physically nonlinear problems in structural mechanics. Linearization of nonlinear problems. Newton-Raphson method and its applications to nonlinear problems in mechanics (elasto-plastic). Finite difference method and numerical integration methods for equations of motion. Conditional and unconditional stability of time integration methods. Introduction to the boundary element method.*

#### Laboratory

1. *Analysis of elastic plates by the finite element method.*
2. *Elasto-plastic analysis of two-dimensional structures (plate or frame) by the finite element method.*

#### LEARNING OUTCOMES:

Competence and skill to understand and use (i) the finite element approximation and modelling of systems of any geometry, (ii) the FEM algorithms for advanced structural problems, (iii) contemporary computer methods in engineering practice, and (IV) advanced computer programs for engineering calculations.

#### ASSESSMENT CRITERIA:

Lecture – *to receive a credit for final test.*

Project – *to receive a credit for all projects and tests.*

#### RECOMMENDED READING:

1. Rakowski G., Kacprzyk Z.: *Metoda elementów skończonych w mechanice konstrukcji*, Wyd. PW, Warszawa 2005.
2. Zienkiewicz O.C., *Metoda elementów skończonych*. Arkady, Warszawa 1972.
3. *Praca zbiorowa, Mechanika budowli: ujęcie komputerowe*, t. 2 , t. 3, Arkady, Warszawa 1992, 1995
4. Łodygowski T., Kąkol W., *Metoda elementów skończonych*. Politechnika Poznańska, Poznań 1994.
5. Rajche J., Pryputniewicz S., Bryś G., *Projektowanie wspomagane komputerem. Cz. II: Metoda elementów skończonych*. WSiInż., Zielona Góra 1991.
6. Piecha, *Programowanie w języku Fortran 90 i 95*. Politechnika Warszawska, Warszawa 2000.
